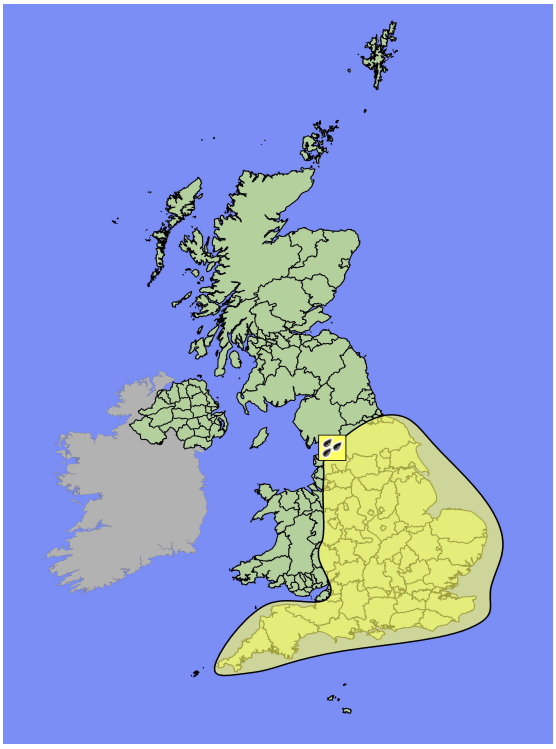
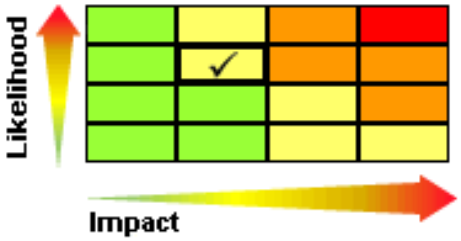
National Severe Weather Warning Service





Chief Forecasters Assessment
An active frontal zone will become slow-moving aligned west to east across England and Wales on Friday. Amounts of rainfall are likely to be 10 to 15 mm for most and 20 to 40 mm locally. These larger totals are more likely in parts of central, northern and eastern England. There is, additionally, a small risk of isolated 60 mm. The general rainfall amounts would not normally present too many problems, but given the wet ground some localised flooding is possible. There remains uncertainty in the position of the frontal zone and heaviest rain so please watch for possible updates to this alert.

The Met Office have issued a **Yellow Alert** of **Rain**

Valid from **00:05 on Fri, 13th Jul 2012** until **23:59 on Fri, 13th Jul 2012**

Many parts of central, eastern and southern England will have further spells of rain on Friday which will be heavy in places. The more persistent rain appears more likely across parts of central, northern and eastern England whilst somewhat drier conditions may well extend across southern counties. However, even here, there is the risk of some heavy showers.

The public should be aware that given saturated ground across many parts, localised flooding may result
